

How to Sync Defects in Exalate for ServiceNow

Last Modified on 01/28/2026 7:48 am EST

In ServiceNow, defects are related to unexpected product behavior. Defects are available as part of the Agile Development application. You can sync defects with Exalate for ServiceNow.

ServiceNow

Outgoing Sync

Example of a script to send defect data:

```
if(entityType == "defect") {  
    replica.short_description = defect.short_description  
    replica.description = defect.description  
    replica.correlation_id = defect.correlation_id  
    replica.correlation_display = defect.correlation_display  
    replica.assigned_to = defect.assigned_to  
}
```

This script sends data for the following fields of the defect table:

- `short_description`
- `description`
- `correlation_id`
- `correlation_display`
- `assigned_to`

ServiceNow

Incoming Sync

Example of a script to receive defect data:

```
if(entityType == "defect") {  
    defect.short_description = replica.summary  
    defect.description = replica.description  
    defect.correlation_id = replica.key  
    defect.correlation_display = "IDalko-Jira"  
    defect.assigned_to = nodeHelper.getUserByEmail(replica.assignee?.email)?.key  
}
```

With this script, we can sync data with Jira issues: summaries, descriptions, assignees.
