Yes, Exalate is designed to handle enterprise-scale integration requirements with unlimited active items in sync, priority support, and boosted sync processing capacity through the Enterprise subscription plan. Large organizations benefit from features specifically built for complex deployment scenarios including role-based access control, data residency options, and flexible billing terms that accommodate enterprise procurement processes.

The platform's security infrastructure meets enterprise standards with ISO certification, encryption of data both in transit and at rest, and full operational control over synchronization on each side of the integration. Enterprise deployments also gain access to advanced capabilities like versioning and rollback for sync configurations, allowing teams to manage changes safely across multiple connections. The unified console provides centralized visibility into all integrations while maintaining autonomous control for different teams or business units. Organizations requiring connectors for proprietary or legacy systems can work with Exalate on custom connector development as an optional add-on to Enterprise plans.
